

Project Plan

To support impactful research, the project will integrate data on teacher professional learning and student outcomes. This allows researchers to examine complex relationships between social background, teacher development, learning platform use, and student performance.

A key goal is to increase awareness of the Florida Data Lagoon and encourage new research projects through a competitive RFP process. This initiative will target scholars unfamiliar with the platform and those with limited experience in digital learning research. By expanding access and engagement, the project aims to enhance the use of large-scale educational data to drive meaningful research and improvements in math education.
